

Installations Screen

Build a small screen for browsing a list of software installations, with search and filtering. Plain React, no tricks.

DURATION 10–15 minutes

FORMAT Screen shared, talk as you go

STYLING Does not matter

01

The context

Our support team uses a web portal to look after customers. One of its screens lists every installation of our software registered to a customer — which machine it is on, which version it runs, and whether it is currently reachable.

With a few hundred installations on screen, the representative needs to narrow the list down quickly. That is the screen you are building.

02

Roughly what it looks like

Installations

All statuses 

Showing 3 of 7 installations

LAB-PC-01	4.2.1	ONLINE
SEQ-WS-11	4.1.8	ERROR
QC-STATION	3.9.4	OFFLINE

The rough shape only. Layout, markup and styling are entirely up to you — unstyled elements stacked down the page are a perfectly good answer. Nothing here is a design specification.

What to build

- 1 **Render the list.** Show each installation's machine name, version and status.
- 2 **Search.** A text box that filters by machine name as the user types. Case-insensitive.
- 3 **Status filter.** Let the user narrow to All, Online, Offline or Error. Buttons or a dropdown, whichever you prefer.
- 4 **A count.** Something like *"Showing 3 of 7 installations"*.
- 5 **An empty state.** A sensible message when nothing matches.

Search and the status filter must work together — narrowing by status should not discard what has been typed, and vice versa.

If you finish early

Clicking a row selects it, and that installation's details appear in a panel beside the list. Only one row is selected at a time, and it should be obvious which one.

The data

Already in `src/App.jsx`. Treat it as though it arrived from an API — there is no need to change it.

```
const INSTALLATIONS = [
  { id: "i-1041", machineName: "LAB-PC-01", version: "4.2.1", status: "Online" },
  { id: "i-1042", machineName: "LAB-PC-02", version: "4.2.1", status: "Offline" },
  { id: "i-1043", machineName: "SEQ-WS-11", version: "4.1.8", status: "Error" },
  { id: "i-1044", machineName: "LAB-PC-07", version: "4.2.0", status: "Online" },
  { id: "i-1045", machineName: "QC-STATION", version: "3.9.4", status: "Offline" },
  { id: "i-1046", machineName: "SEQ-WS-12", version: "4.2.1", status: "Error" },
  { id: "i-1047", machineName: "LAB-PC-03", version: "4.0.2", status: "Online" },
];
```

Getting started

Open the starter project in your browser — nothing to install, no account needed:

```
https://stackblitz.com/github/dpjiitkgp/react-test
```

Or work locally if you prefer:

```
git clone https://github.com/dpjiitkgp/react-test.git
cd react-test
npm install
npm run dev
```

Everything you need is in `src/App.jsx`.

Ground rules

- **Styling genuinely does not matter.** There are a few optional helper classes in `src/index.css`. Use them, ignore them, or delete the file.
- **Plain React is expected** — no router, no state library, no component kit. Reach for one only if you would genuinely rather.
- **Think out loud.** We are more interested in how you approach it than in whether every requirement is finished.
- **Ask us anything.** If something is ambiguous, that is a real gap in the brief rather than a trap — say so and we will answer.
- **Getting stuck is fine.** Tell us what you are stuck on. We would far rather talk it through than watch you struggle in silence.
